Full-stack engineer with 4+ years shipping production web platforms and applied-AI features end to end, plus Arc, a solo-built cockpit for AI coding agents. Comfortable owning a feature from React/Next.js frontend through Java/Python and Node backends on PostgreSQL/Elasticsearch — recently shipping LLM and ML features into a multi-tenant enterprise security platform.

EXPERIENCE

MozoX Apr 2023 – Present

Full-stack Engineer

- Shipped production LLM features for a multi-tenant enterprise SIEM platform processing ~1,000 security events/sec: an AI log parser mapping arbitrary log sources to schema fields with no hand-written parser (new-source onboarding from ~7 days to minutes; ~20% of total log volume now parsed by the AI pipeline), natural-language-to-query search, and AI-generated multilingual executive reports.
- Built an AI correlation engine combining Isolation Forest, autoencoder, and Z-score models with automated MITRE ATT&CK mapping for real-time, multi-tenant threat detection; grouped its detections into signature cards, cutting the analyst triage queue by 95–97% on two production tenants over 30 days.
- Built an agentic investigation engine (LangGraph) that probes anomalies over PostgreSQL and Elasticsearch on redacted, tokenized data and proposes correlation rules for analyst approval, at under 2 cents each.
- Built full-stack across the platform (Next.js/React, Java + Python, PostgreSQL + Elasticsearch); integrated 4+ security-vendor log sources (Check Point, F5, CrowdStrike, VMware ESXi) and MITRE ATT&CK dashboards.
- Initiated and led a web-application modernization effort (dependency upgrades, tech-debt reduction) with zero disruption to the live system; built centralized cross-component system-log monitoring.

CNG Mar 2022 – Apr 2023

Full-stack Engineer

- Led a team of 3 to build a property-search web app (Next.js, Tailwind, Nest.js, Mapbox) letting users browse and buy properties on an interactive map.
- Implemented geospatial computation and vector-tile rendering to display property polygons on Mapbox.
- Translated business requirements into technical specs, decomposed them into components, and reviewed teammates' code across architecture, implementation, testing, and deployment.

PROJECTS

Arc — Desktop cockpit for AI coding agents github.com/kaeltran16/waveterm

- Solo-built on a fork of Wave Terminal: migrated the desktop shell from Electron to Tauri (Rust), with a React 19 frontend over typed RPC to a Go backend and TypeScript bindings generated from the Go types.
- Built a Go DAG engine that runs parallel Claude Code workers in isolated git worktrees, reviews the plan before any worker starts, and merges each branch behind verification gates.

Opal — Full-stack iOS personal-OS app github.com/kaeltran16

- Solo-built a cross-stack app: Flutter client + Node/TypeScript backend with an LLM proxy (PII redaction, structured-output schemas) powering an AI assistant, plus IMAP-based receipt parsing.
- Native iOS integration: Live Activities, Siri App Intents, home-screen widgets, local notifications.

TECHNICAL SKILLS

Languages & Frameworks: TypeScript/JavaScript, Python, Go, Java, React, Next.js, Nest.js, Express.js, Spring Boot

AI & Data: LLMs (OpenAI, LangChain, LangGraph), agentic tool use, RAG, machine learning, anomaly detection, PostgreSQL, Elasticsearch, MQTT, time-series processing

DevOps & Tools: Docker, Kubernetes, CI/CD, REST APIs, WebSockets, Git, Mapbox, Tailwind CSS

EDUCATION

Seneca College of Applied Arts and Technology — Diploma in Computer Programming (2019)
